Master 1 Problem Solving: Lab sessions

Attendance at Lab sessions (TP) is mandatory and Each Lab session is graded.

Grading

Your project grade will be based on three tasks:

— writing a clear, well-structured, and rigorous report;

— providing well-structured and readable source code, with relevant test cases;

— actively participating in a demonstration of your software.

In particular, every lab session will be graded, and any student who does not make a significant contribution risks receiving a grade of 0 for the session and therefore for the project.

Organization

For this project, students must work in groups of two, choose one of the suggested topics, or propose a topic and obtain the instructor's approval.

Deliverables Your team must produce:

1. A report in which:
   — you describe the problem you have chosen (rules, examples, constraints);
   — you formalize the problem as a search problem;
   — you describe the state-space graph and the Backtracking algorithm used to solve your problem;
   — you explain the key aspects of your program's implementation;
   — you illustrate the use of your programs with relevant examples.
2. A set of programs:
   — an interface that takes an instance of the problem as input and displays a solution;
   — a carefully selected set of problem instances that can be used to test your modeling.

Schedule

— This document is available online from the very beginning of the course.

— Submit a progress report via Moodle after each session.

— Submit the final report and source code via Moodle.

— Present your project.
